Revised:

Identify Job as Running in Batch Mode

`IFBATCH` allows an executing module to determine whether it is running in batch mode or not.

Structure:

`FUNCTION` subprogram
User Entry Names: `IFBATCH`

Usage:

In any logical expression,

```
IFBATCH()
```

has the value `.TRUE.` if the module is executing in batch mode and `.FALSE.` otherwise. Note that `IFBATCH` must be declared `LOGICAL` in the calling routine.
